Unbotify

The next level of bot and hardware cheat detection – leaving cheaters and bot farms with no place to hide.

5 to 15% of gamers admit to using bots to get ahead in a game.

More and more of them also use hardware cheats to gain an unfair advantage.

Unbotify detects bots and hardware cheats in real time

Custom machine learning models for your app are used to immediately distinguish bots and modified hardware from real users. This is done by evaluating behavioral data including touch events and the device's sensors:

- Accelerometer
- Gyroscope
- Light sensors
- Touch pressure

Bots and hardware cheats result in:

- Disinterested players
- Churn
- Fewer in-app purchases
- Diminished LTV
- Weakened reputation

Light Sensor

Battery Status

Touch Event
• Duration
• Area
• Pressure

Accelerometer

Cutting edge anomaly detection
Uses AI for behavioral biometrics data analysis

Top accuracy in real-time
Contextually aware, identifies bots in real-time with 99.8% accuracy

Tailored to your app flow
Built on authentic user data and their specific in-app actions

Global data privacy compliance
Fully compliant with the GDPR and the CCPA

Stop professional bot farms from profiting by selling in-game assets they gained illegitimately and effortlessly. Protect your in-app purchases and your game reputation. Keep your legitimate players engaged and happy.
